TABLEAU • DATA ANALYTICS

Global Fuel Prices and Taxation Trends

A comparative analysis of petrol prices, crude oil, regional taxation, subsidies and income levels

PROJECT PRESENTED BY

Vidhi Sharma

Medicaps University | October 2026

PROJECT OVERVIEW

What this project explores

A Tableau dashboard for comparing fuel-price patterns across countries, regions and socio-economic categories.

PROJECT SUMMARY

Fuel prices are shaped by multiple factors—not only the cost of crude oil, but also taxation, subsidies, policy choices, transport costs and local market conditions.

This project uses interactive visual analytics to make those comparisons easier to explore.

MAIN OUTPUT

A multi-view dashboard with a map, trend view, country ranking, regional tax comparison, and subsidy / income breakdowns.

10
Countries in price ranking
Top-price comparison

7
Regional groups
Regional tax comparison

3
Policy / context lenses
Tax, subsidy, income

2
Price series
Petrol and Brent crude

Note: Counts describe the views shown in the current Tableau dashboard. Figures are taken from visible dashboard labels and should be checked against the source data before final submission.

OBJECTIVES

Questions the dashboard is designed to answer

The analysis is descriptive: it compares visible patterns and associations rather than proving cause and effect.

01

Compare countries

Identify which countries have the highest displayed average petrol prices.

02

Compare regions

Explore how average fuel-tax percentages vary by region.

03

Study time trends

View petrol-price movement over time alongside Brent crude oil.

04

Explore context

Compare average petrol prices across subsidy and income categories.

KEY QUESTION

How do displayed fuel prices differ across places and policy categories—and what should we investigate next?

From dataset to interactive dashboard

The workbook’s current views indicate the following fields and analytical steps. Confirm field names and units in the final data source.

FIELDS USED IN THE VIEWS

Geography	Country, Region
Time	Date / quarter
Price	Average petrol price (USD/L)
Crude oil	Brent crude (USD/bbl)
Tax	Tax as % of fuel price
Categories	Income level, subsidy level

ANALYTICAL WORKFLOW

01 **Import** — Connect Tableau to the source file.

02 **Prepare** — Check data types, missing values, units and dates.

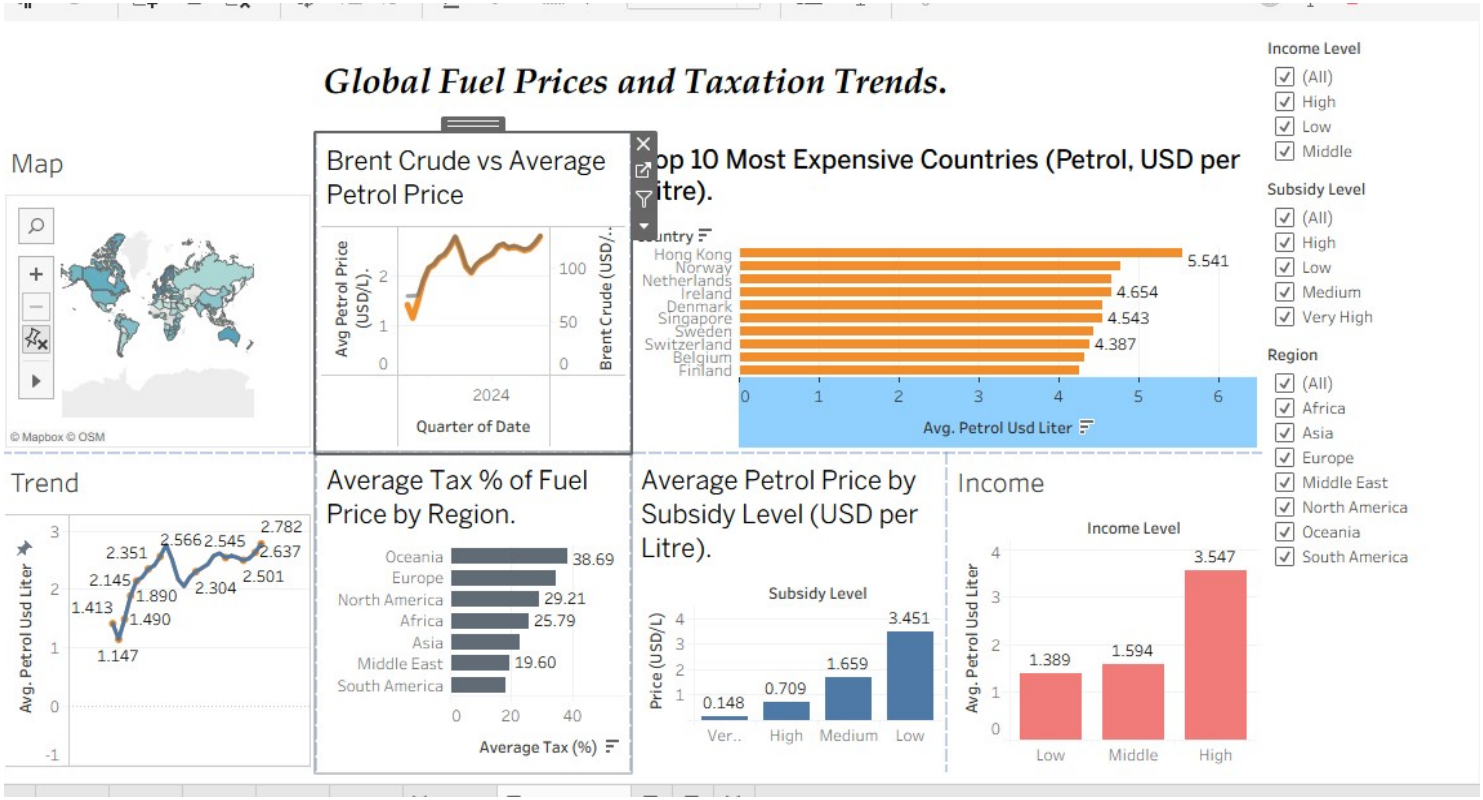

03 **Analyze** — Aggregate measures and build comparative charts.

04 **Assemble** — Arrange worksheets and add region / income / subsidy filters.

05 **Validate** — Compare displayed figures with the CSV before reporting.

One dashboard, multiple ways to compare

The current workbook brings together geographic, time-series and category comparisons in a single view.

Current Tableau Desktop view (work in progress)

Map Global distribution

Trend Petrol vs. crude oil

Ranking Top-priced countries

Regional bars Average tax percentage

Category bars Subsidy and income levels

Interactivity: use the filters to explore how the displayed views change by region, income level and subsidy level.

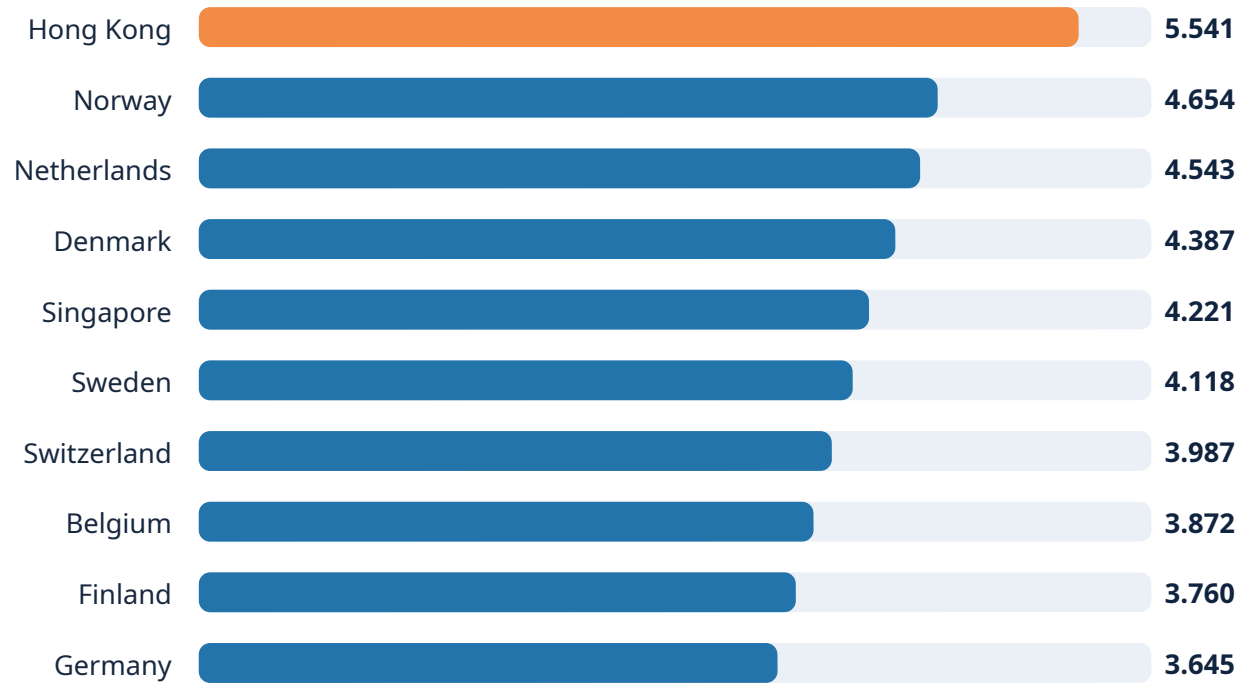

COUNTRY COMPARISON

Top 10 countries by displayed petrol price

Average petrol price (USD per litre) — values transcribed from the current Tableau view.

Highest displayed average petrol prices

USD per litre • descending order

HIGHEST IN THIS VIEW

Hong Kong

5.541 USD/L

The next two entries are Norway and the Netherlands.

HOW TO INTERPRET

- These are dashboard averages, not a claim about every fuel station.
- Country ranking does not by itself explain why prices differ.

Source note: verify against the project CSV before formal submission.

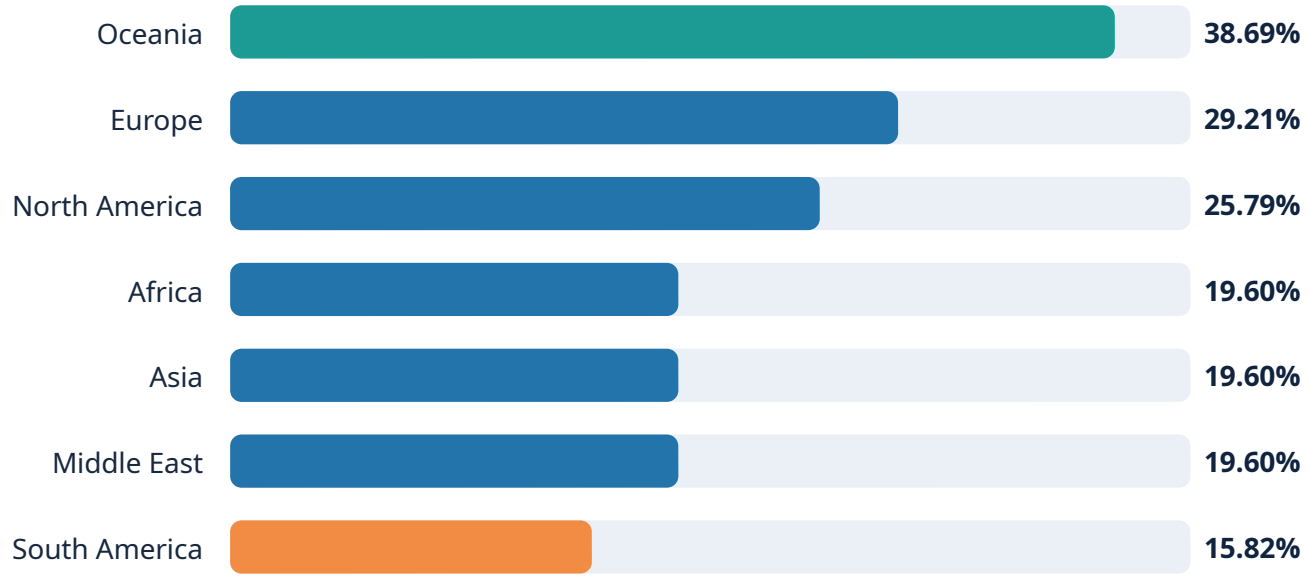

REGIONAL COMPARISON

Average tax as a share of fuel price

Percentages displayed in the current Tableau view; labels are reproduced as shown.

Average tax % of fuel price by region

Average tax share (%)

HIGHEST DISPLAYED TAX SHARE

Oceania

38.69%

LOWEST DISPLAYED TAX SHARE

South America

15.82%

Check whether regional averages use comparable country coverage and the same period.

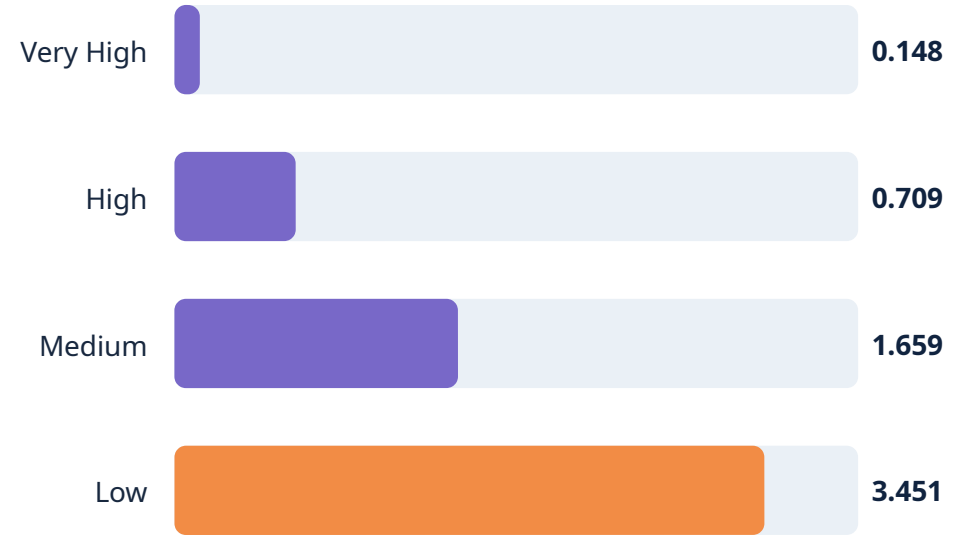

CATEGORY COMPARISONS

Petrol prices by subsidy and income level

These charts show association between the categories and the displayed average price; they do not establish causation.

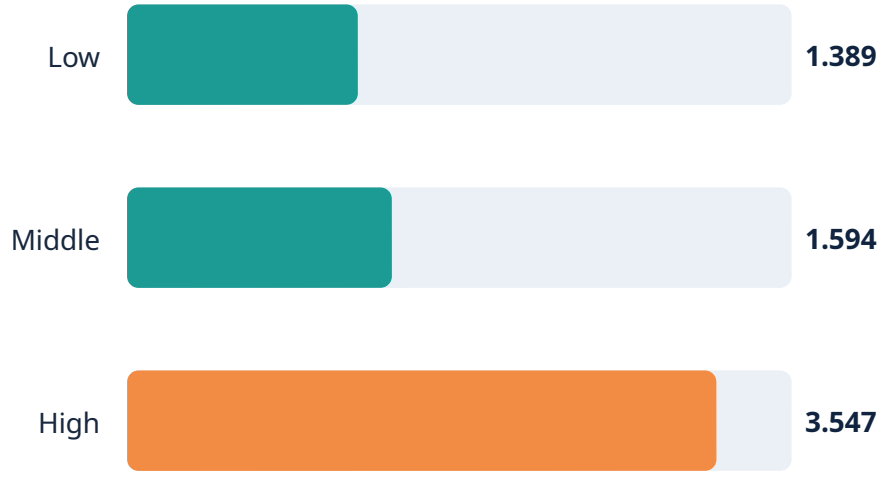

Average price by subsidy level

USD per litre

Average price by income level

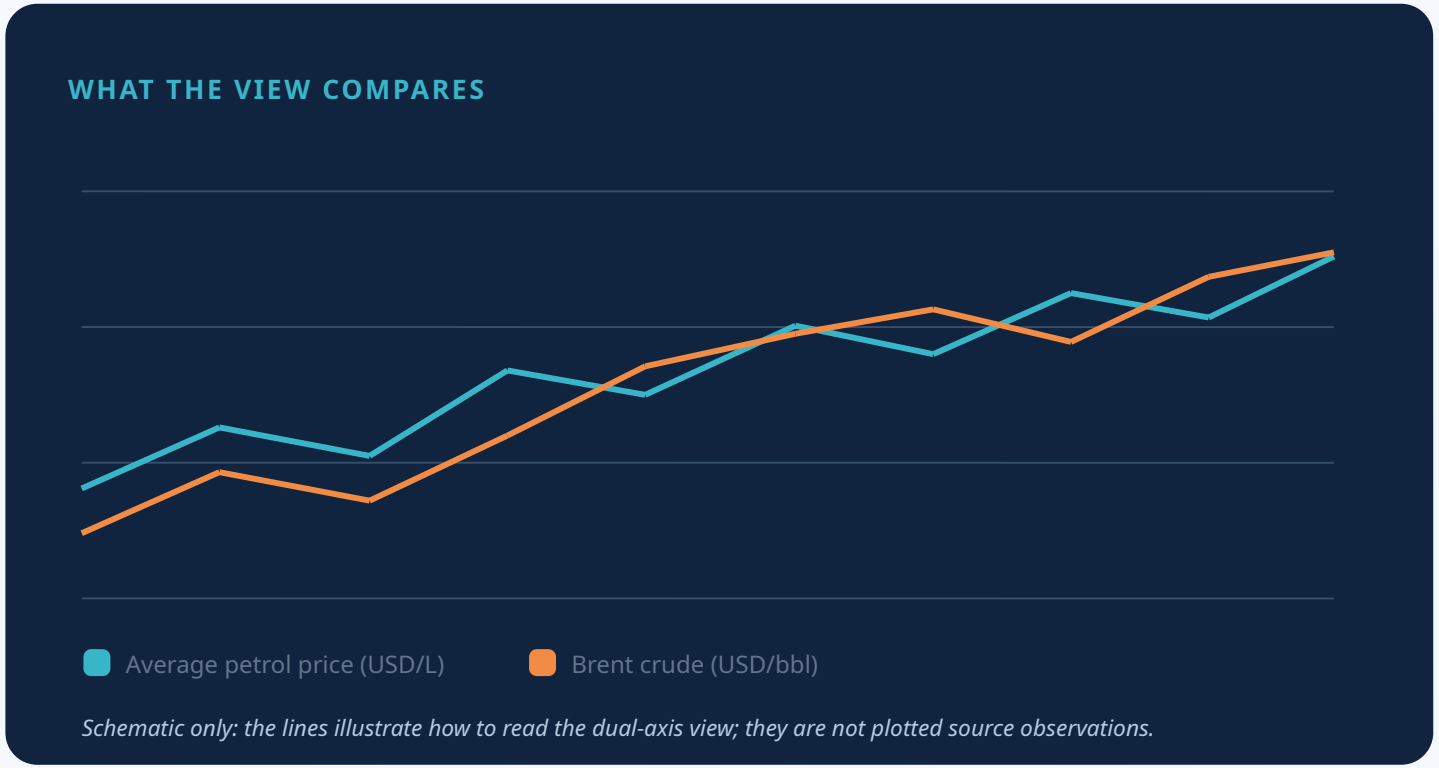

USD per litre

Interpret cautiously: category definitions, country coverage and other policy / market factors may affect these averages.

Compare petrol prices with Brent crude over time

The workbook uses a dual-axis trend view, so each series has its own scale and unit.

1 • Match the time period

Check whether dates are monthly, quarterly or yearly.

2 • Respect the two axes

USD/L and USD/bbl are different units and scales.

3 • Look for timing and gaps

Compare direction and turning points; don’t assume causality.

For the final report, replace this schematic with a freshly exported chart from the actual Tableau workbook.

SUMMARY OF VISIBLE PATTERNS

What the current dashboard suggests

Interpret these as descriptive observations from the displayed dashboard—not proof of what causes fuel prices to change.

01

Country prices differ widely

Hong Kong is the highest entry in the current top-10 view at 5.541 USD/L.

02

Tax shares vary by region

Oceania is highest at 38.69%, while South America is lowest at 15.82% in the displayed comparison.

03

Category averages diverge

The displayed low-subsidy and high-income groups have the highest category averages in their respective charts.

04

Time context matters

The time-series view should be read alongside crude-oil movement, using each axis's own units.

RECOMMENDED NEXT CHECKS

Confirm the CSV, filters, aggregation level, data coverage and units before treating displayed values as final results.

A useful starting point for fuel-price comparison

The dashboard consolidates several dimensions into one accessible visual analysis.

CONCLUSION

The project demonstrates how Tableau can bring together geographic patterns, rankings, time trends and category comparisons to explore fuel prices and taxation.

Interactive filters help users narrow the view and ask more focused questions.

LIMITATIONS TO ACKNOWLEDGE

- Values are averages and may hide differences within a country.
- The result depends on the dataset's date range and country coverage.
- Tax, subsidy and income categories may not be directly comparable.
- Observed associations do not establish cause and effect.

Next step: validate all displayed figures against the original dataset and publish the final workbook when it is ready.
